ASSIGNMENT-1

Page No.

Date: / /

1) What is mvc?

Mvc (Model - View - Controller) is a software architectural pattern commonly used for developing user interface. It separates an application into three interconnected components.

1) Model - Manages data, logic, and rules of the applications.

2) View: Handles display and user interface representation.

3) Controller: Acts an intermediary between the model and the view; receives user input and updates model and view control.
